AgentOS Studio

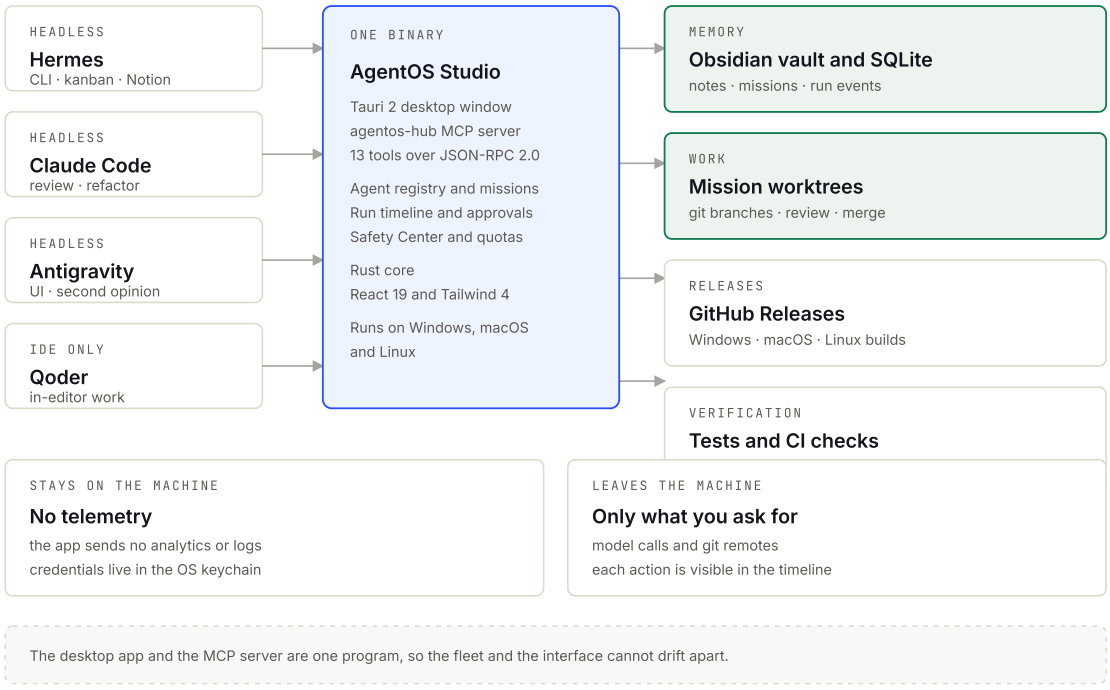

PUBLIC PREVIEW, V0.13.0

THE STUDIO THAT RUNS THE FLEET

A local control plane for a multi-agent fleet: one desktop app where agents take work from a shared bus, write to one memory, show every action in a timeline, and merge only after the checks pass.

STATUS Public preview, v0.13.0	BINARY One program, desktop app and hub server	HUB TOOLS 13 over JSON-RPC 2.0
AGENTS 4, headless and IDE	DATA Local SQLite and the Obsidian vault	LICENCE MIT

ARCHITECTURE

Agents reach the same hub as the desktop app because both run inside one binary. Memory, worktrees, releases and checks stay on the machine or in the repository.

○ ONE BINARY ○ LOCAL RECORD ○ EXTERNAL SERVICES

DECISIONS THAT SHAPED IT

ARCHITECTURE — SHIPPED

One binary, two roles

The desktop application and the MCP hub server ship as one Rust program, with the JSON-RPC server started from the same executable.

Why. Two programs would drift: the window would show a queue the agents do not use, or the agents would write a record the window cannot read. Shipping one binary removes that class of bug.

PRIVACY — SHIPPED

Local record, no telemetry

State lives in SQLite and the Obsidian vault on the machine. The app sends no analytics and keeps credentials in the OS keychain.

Why. The record contains client repositories, branch names and agent conversations. Moving it to a hosted service would create a breach target without making the fleet better.

SAFETY — SHIPPED

Merge only after the checks

Missions move through plan, worktree, review, merge and verify, and a merge is refused when its checks have not passed.

Why. An agent that can merge without evidence turns a small mistake into a broken main branch. The gate costs a few minutes and removes that failure.

WHAT IS REAL, AND WHAT IS NOT

AREA	STATUS	NOTE
Release state	v0.13.0	Installers are on GitHub Releases and unsigned, so the operating system asks once before the first run.
Download site	Preview	The download site is built and reviewed but not yet deployed. The live link appears at 1.0.
Telemetry	None	The app sends no analytics and no remote logging.
Tests	Measured	Full Rust suite on 9 November 2026: 320 passed, 0 failed, 52 ignored.
Quotas	Measured	Usage comes from Hermes. Qoder and Antigravity report no quota to the app.
Licence	MIT	Source and installers are public under the MIT licence.

STACK

Rust · Tauri 2 · React 19 · TypeScript · Tailwind 4 · SQLite · JSON-RPC 2.0 · MCP · Obsidian
