# Vigil

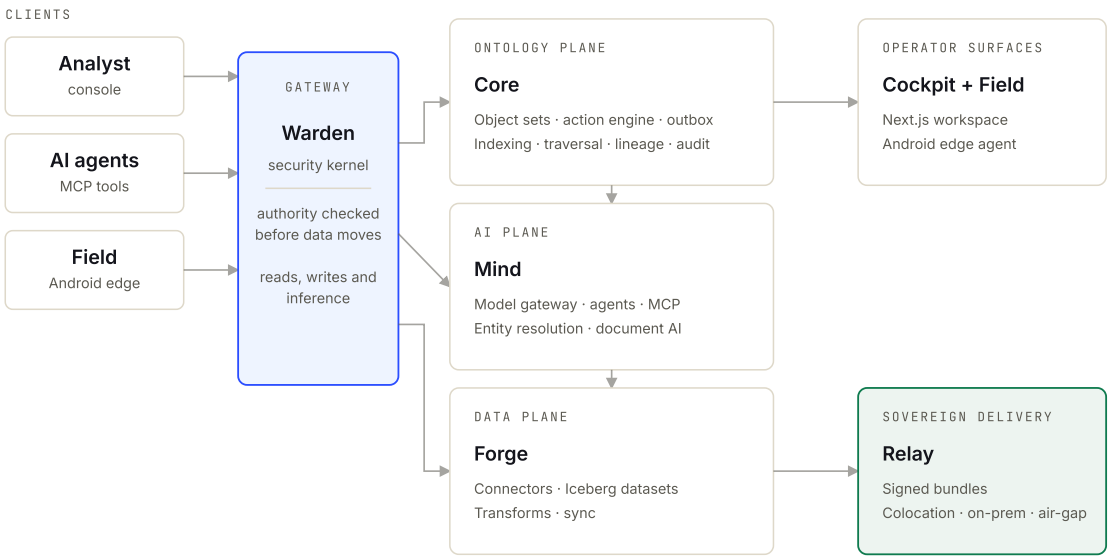

SOURCE AVAILABLE, IN DEVELOPMENT

PROJECT CODENAME, PENDING TRADEMARK CLEARANCE

A sovereign operational-intelligence platform that models assets, people, places and events as a governed ontology, so operators and AI agents can act on the same version of the truth.

| STATUS | BRANCH | ARCHITECTURE |
|---|---|---|
| In development, no live deployment | develop (main is an empty shell) | 12 ADRs, frozen at P0 v1.0 |
| **ROADMAP** | **DEPLOYMENT** | **ONTOLOGY** |
| Plan spans P0 to P43 | Sovereign first, air-gap capable | Metadata layer over polyglot persistence |

## ARCHITECTURE

Every read, write and inference passes through Warden before it reaches data or a model.
Default topology: South African colocation, customer premises or an air-gapped appliance.

Every request enters through the gateway and Warden before it reaches the ontology, data or AI planes. Relay carries signed bundles to sovereign and air-gapped targets.

SECURITY SURFACE · SERVICE PLANE · SOVEREIGN DELIVERY

## DECISIONS THAT SHAPED IT

ADR-0002 PROPOSED (P0)

### The ontology is not a graph database

The ontology is a metadata-driven layer over polyglot persistence. Graph engines can only be replaceable projections, never the system of record.

**Why.** Operational traversals are shallow, while graph databases carry licence and viability risk. The metadata layer keeps storage replaceable and the model stable.

ADR-0004 PROPOSED (P0)

### Sovereign-first deployment

The default topology is South African colocation, customer premises or air-gapped. Hyperscaler regions are a separately labelled commercial tier.

**Why.** No required egress and no prompt leaving South Africa can be tested guarantees rather than marketing language, because the deployment model is the default.

ADR-0006 PROPOSED (P0)

### Vigil is a codename

The product name is a codename until trademark clearance is complete, and public copy labels it as such.

**Why.** Naming a platform after a word with existing marks is a legal risk. The codename keeps the architecture public without committing the brand.

## WHAT IS REAL, AND WHAT IS NOT

| AREA | STATUS | NOTE |
|---|---|---|
| **Live service** | Not live | No public deployment. The platform is in development. |
| **Source** | Available | Public repository on the develop branch. |
| **Licence** | Not declared | Source available, not open source. No licence is granted by default. |
| **Architecture** | Proposed | The P0 ADRs are proposed and await founder sign-off, not accepted. |
| **Demo data** | Fictional | Every demo identity in the repository is explicitly fictional. |
| **AI claims** | Designed | Agents are designed and specified. They are not in production. |

## STACK

`Java 25` `Spring Boot 4` `Spring Modulith 2` `Rust` `Python 3.13` `FastAPI` `TypeScript` `Next.js` `Go` `Kotlin` `Elixir` `PostgreSQL` `Apache Iceberg` `OpenSearch` `ClickHouse` `Kafka` `NATS JetStream` `Temporal`
